**In the Claims:**

On page 23, cancel line 1 and substitute the following left-hand justified heading therefor:

**--We Claim As Our Invention--.**

Please cancel claims 1-27, without prejudice, and substitute the following claims therefor:

28. A method for encoding a digital message, the method comprising the steps of:

encoding the digital message to form an encoded message upon employment of an encoding format of a network protocol;

subjecting the encoded message to at least one cryptographic process to form a cryptographically processed message; and

encoding the cryptographically processed message upon employment of the encoding format of the network protocol.

29. A method for decoding an encoded, cryptographically processed message that is present in an encoding format of a network protocol, the method comprising the steps of:

decoding the encoded, cryptographically processed message according to the encoding format of the network protocol to form a decoded, cryptographically processed message;

subjecting the decoded, cryptographically processed message to a second cryptographic process inverse relative to an at least one first cryptographic process, which previously encoded an original digital message, to form an inversely cryptographically processed message; and  
5 decoding the inversely cryptographically processed message according to the encoding format of the network protocol.

30. A method for encoding a digital message, for transmitting the digital message from a first computer unit to a second computer unit and  
10 for decoding the digital message, the method comprising the steps of:

encoding the digital message, in the first computer unit, to form an encoded message upon employment of an encoding format of a network protocol;

subjecting the encoded message, in the first computer unit, to at least one first cryptographic process to form a crypto graphically processed message;

encoding the cryptographically processed message, in the first computer unit, upon employment of the encoding format of the network protocol to form an encoded, cryptographically processed message;

20 transmitting the encoded, cryptographically processed message from the first computer unit to the second computer unit;

decoding the encoded, cryptographically processed message, in the second computer unit, according to the encoding format of the network protocol to form a decoded, cryptographically processed message;

25 subjecting the decoded, cryptographically processed message, in the second computer unit, to a second cryptographic process inverse relative to the at least one first cryptographic process to form an inversely cryptographically processed message; and

decoding the inversely cryptographically processed message, in the second computer unit, into the digital message according to the encoding format of the network protocol.

5                    31.            A method for encoding a digital message, for transmitting the digital message from a first computer unit to a second computer unit and for decoding the digital message as claimed in claim 30, further comprising the steps of:

10                    including a request for implementing a prescribable action in the digital message;

                    implementing the prescribable action in the second computer unit to obtain a result of the prescribable action; and

                    sending the result of the prescribable action from the second computer unit to the first computer unit in a reply message.

15                    32.            A method for encoding a digital message, for transmitting the digital message from a first computer unit to a second computer unit and for decoding the digital message as claimed in claim 30, further comprising the steps of:

20                    including a request for implementing a prescribable action in the digital message;

                    implementing the prescribable action in the second computer unit to obtain a result of the prescribable action;

25                    forming a reply message which contains the result of the prescribable action in the second computer unit;

                    encoding the reply message in the second computer unit according to the encoding format of the network protocol to form an encoded reply message;

subjecting the encoded reply message to at least one cryptographic process in the second computer unit to form a cryptographically processed reply message;

5 storing the cryptographically processed reply message in the second computer unit;

encoding a fetch message in the first computer unit according to the encoding format of the network protocol, wherein the cryptographically processed reply message is requested from the second computer unit with the fetch message;

10 transmitting the fetch message from the first computer unit to the second computer unit;

receiving the fetch message by the second computer unit;

15 encoding the cryptographically processed reply message according to the encoding format of the network protocol to form an encoded, cryptographically processed reply message; and

transmitting the encoded, cryptographically processed reply message from the second compute unit to the first computer unit.

33. A method for encoding a digital message, for transmitting the digital message from a first computer unit to a second computer unit and for decoding the digital message as claimed in claim 30, the method further comprising the steps of:

including a request for implementing a prescribable action in the digital message;

25 implementing the prescribable action in the second computer unit to obtain a result of the prescribable action;

forming a reply message which contains the result of the prescribable action in the second computer unit;

encoding the reply message in the second computer unit according to the encoding format of the network protocol to form an encoded reply message;

5           subjecting the encoded reply message to at least one cryptographic process in the second computer unit to form a cryptographically processed reply message;

          encoding the cryptographically processed reply message according to the encoding format of the network protocol to form an encoded, cryptographically processed reply message; and

10           transmitting the encoded, cryptographically processed reply message from the second computer unit to the first computer unit.

34.           A method for encoding a digital message, for transmitting the digital message from a first computer unit to a second computer unit and for decoding the digital message as claimed in claim 33, wherein the cryptographically processed reply message is stored in a management information base in the second computer unit.

35.           A method for encoding a digital message as claimed in claim 28, wherein the network protocol is a simple network management protocol version 1.

36.           A method for encoding a digital message as claimed in claim 35, further comprising the steps of:

25           forming a set request in the first computer unit upon encoding the cryptographically processed message; and

          transmitting the set request from the first computer unit to the second computer unit.

37. A method for encoding a digital message, for transmitting the digital message from a first computer unit to a second computer unit and for decoding the digital message as claimed in claim 32, further comprising the steps of:

employing a get request as the fetch message; and  
forming a get response upon the encoding of the requested, cryptographically processed reply message.

38. A method for encoding a digital message, for transmitting the digital message from a first computer unit to a second computer unit and for decoding the digital message as claimed in claim 31, further comprising the step of:

transmitting as the prescribable action at least one of an information query and an information indication of the second computer unit.

39. An apparatus for encoding a digital message, the apparatus comprising:

means for encoding the digital message upon employment of an encoding format of a network protocol to form an encoded message;

means for cryptographically processing the encoded message to form a cryptographically processed message; and

means for encoding the cryptographically processed message upon employment of the encoding format of the network protocol.

40. An apparatus for decoding an encoded, cryptographically processed message that is present in an encoding format of a network protocol, the apparatus comprising:

means for receiving the encoded, cryptographically processed message from a first computer unit;

means for decoding the encoded, cryptographically processed message according to the encoding format of the network protocol to form a decoded, cryptographically processed message;

means for inversely cryptographically processing the decoded, cryptographically processed message to form an inversely cryptographically processed message; and

means for decoding the inversely cryptographically processed message according to the encoding format of the network protocol.

41. An apparatus for encoding, transmitting and decoding a digital message, comprising:

a first computer unit, the first computer unit including means for encoding the digital message upon employment of an encoding format of a network protocol to form an encoded message, means for cryptographically processing the encoded message to form a cryptographically processed message, means for encoding the cryptographically processed message upon employment of the encoding format of the network protocol to form an encoded, cryptographically processed message, and means for sending the encoded cryptographically processed message from the first computer unit to the second computer unit; and

a second computer unit, the second computer unit including means for receiving the encoded cryptographically processed message from the first computer unit, means for decoding the encoded cryptographically processed message according to the encoding format of the network protocol to form a decoded cryptographically processed message, means for inversely cryptographically processing the decoded cryptographically processed message to form an inversely cryptographically processed message, and means for decoding the inversely cryptographically processed message according to the encoding format of the network protocol.;

42. An apparatus for encoding a digital message as claimed in claim 39, wherein the means for encoding the digital message is further provided as the means for encoding the cryptographically processed message.

43. An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 41, wherein the means for encoding the digital message is further provided as the means for encoding the cryptographically processed message.

44. An apparatus for decoding an encoded, cryptographically processed message that is present in an encoding format of a network protocol as claimed in claim 40, wherein the means for decoding the encoded, cryptographically processed message is further provided as the means for decoding the inversely cryptographically processed message.

45. An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 41, wherein the means for decoding the encoded, cryptographically processed message is further provided as the means for decoding the inversely cryptographically processed message.

46. An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 41, wherein the digital message contains a request for implementing a prescribable action, the apparatus further comprising:

means for implementing the prescribable action to obtain a result of the prescribable action, the means for implementing being provided in the second computer unit; and

means for sending the result of the prescribable action to the first computer unit, the means for sending being provided in the second computer unit.

5                    47.            An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 41, wherein the digital message contains a request for implementing a prescribable action, the apparatus further comprising:

10                   means for implementing the prescribable action to obtain a result, the means for implementing being provided in the second computer unit;

                  means for forming a reply message that contains the result of the prescribable action, the means for forming a reply message being provided in the second computer unit;

15                   means for encoding the reply message according to the encoding format of the network protocol to form an encoded reply message, the means for encoding the reply message being provided in the second computer unit;

20                   means for processing the encoded reply message with at least one cryptographic process to form a cryptographically processed encoded reply message, the means for processing the encoded reply message being provided in the second computer unit;

                  means for storing the cryptographically processed encoded reply message, the means for storing being provided in the second computer unit;

25                   means for forming and encoding a fetch message according to the encoding format of the network protocol wherein the cryptographically processed encoded reply message is requested from the second computer unit, the means for forming and encoding a fetch message being provided in the first computer unit;

means for sending the fetch message from the first computer unit to the second computer unit, the means for sending the fetch message being provided in the first computer unit;

means for receiving the fetch message, the means for receiving the fetch message being provided in the second computer unit;

means for encoding the cryptographically processed reply message requested in the fetch message according to the encoding format of the network protocol, the means for encoding the cryptographically processed reply message being provided in the second computer unit; and

means for sending the encoded, cryptographically processed reply message from the second computer unit to the first computer unit, the means for sending the encoded, cryptographically processed reply message being provided in the second computer unit.

48. An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 41, wherein the digital message contains a request for implementing a prescribable action, the apparatus further comprising:

means for implementing the prescribable action to obtain a result of the prescribable action, the means for implementing the prescribable action being provided in the second computer unit;

means for forming a reply message that contains the result of the prescribable action, the means for forming the reply message being provided in the second computer unit;

means for encoding the reply message according to the encoding format of the network protocol to form an encoded reply message, the means for encoding the reply message being provided in the second computer unit;

means for processing the encoded reply message with at least one cryptographic process to form a cryptographically processed encoded reply message, the means for processing the encoded reply message being provided in the second computer unit;

means for encoding the cryptographically processed encoded reply message according to the encoding format of the network protocol to form an encoded, cryptographically processed encoded reply message, the means for encoding the cryptographically processed encoded reply message being provided in the second computer unit; and

means for sending the encoded, cryptographically processed encoded reply message from the second computer unit to the first computer unit, the means for sending the encoded, cryptographically processed encoded reply message being provided in the second computer unit.

49. An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 47, wherein the cryptographically processed reply message is stored in a management information base.

50. An apparatus for encoding a digital message as claimed in claim 39, wherein the network protocol is a simple network management protocol version 1.

51. An apparatus for decoding an encoded, cryptographically processed message that is present in an encoding format of a network protocol as claimed in claim 40, wherein the network protocol is the simple network management protocol version 1.

52. An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 41, wherein the network protocol is a simple network management protocol version 1.

53. An apparatus for encoding a digital message as claimed in claim 39, wherein the network protocol is a simple network management protocol version 1, and wherein the means for encoding the cryptographically processed message is configured such that a set request is formed upon the encoding of the cryptographically processed message.

54. An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 41, wherein the network protocol is a simple network management protocol version 1, and wherein the means for encoding the cryptographically processed message is configured such that a set request is formed upon the encoding of the cryptographically processed message.

55. An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 47, wherein the means for forming and encoding the fetch message is configured such that a get request is formed, and wherein the means for encoding the cryptographically processed reply message requested in the fetch message is configured such that a get response is formed.

56. An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 41, wherein at least one of an information query and an information particular of the computer unit is provided as the prescribable action.

57. An apparatus for encoding, transmitting and decoding a digital message as claimed in claim 56, wherein the means for cryptographically processing the encoded message, the means for encoding the cryptographically processed message and the means for sending the encoded cryptographically processed message are formed together as a first proxy agent, and wherein the means for receiving the encoded cryptographically processed message, the means for decoding the encoded cryptographically processed message and the means for inversely cryptographically processing the decoded cryptographically processed message are formed together as a second proxy agent.

58. A communication system having a manager of a communication network and an intermediate manager of a communication network, the communication system employing the communication network and offering further services that proceed beyond services offered by the communication network to customers, the communication system including an apparatus for encoding a digital message which comprises:

means for encoding the digital message upon employment of an encoding format of a network protocol to form an encoded message;

means for cryptographically processing the encoded message to form a cryptographically processed message; and

means for encoding the cryptographically processed message upon employment of the encoding format of the network protocol.

59. A communication system having a manager of a communication network and an intermediate manager of a communication network, the communication system employing the communication network and offering further services that proceed beyond services offered by the communication network to customers, the communication system including

an apparatus for decoding an encoded, cryptographically processed message that is present in an encoding format of a network protocol, the apparatus comprising:

means for receiving the encoded, cryptographically processed message from a first computer unit;

means for decoding the encoded, cryptographically processed message according to the encoding format of the network protocol to form a decoded, cryptographically processed message;

means for inversely cryptographically processing the decoded, cryptographically processed message to form an inversely cryptographically processed message; and

means for decoding the inversely cryptographically processed message according to the encoding format of the network protocol.

60. A communication system having a manager of a communication network and an intermediate manager of a communication network, the communication system employing the communication network and offering further services that proceed beyond services offered by the communication network to customers, the communication system including an apparatus for encoding, transmitting and decoding a digital message, the apparatus comprising:

a first computer unit, the first computer unit including means for encoding the digital message upon employment of an encoding format of a network protocol to form an encoded message, means for cryptographically processing the encoded message to form a cryptographically processed message, means for encoding the cryptographically processed message upon employment of the encoding format of the network protocol to form an encoded, cryptographically processed message, and means for sending the
